

MOWER WITH MULCHING FUNCTION

ABSTRACT OF THE INVENTION

A mower with a blade housing, in which a blade rotates about a vertical rotational axis in a rotational plane, so that for movement of the mower in the mowing direction, the cutting material is cut corresponding to the diameter of the blade. According to the invention, it is proposed that the front region of the blade housing in the mowing direction be at least partially covered by a base plate, which extends between the blade and the ground, and that the rotational plane of the blade in the operating position be inclined at an angle of more than 0° to 15° to the ground. It can also be provided that the front region of the blade housing in the mowing direction be at least partially covered by a base plate, which extends between the blade and the ground, and that the blade have at least two cutting edges or cutting edge regions with different cutting heights in the radial direction.
